

A smiling male employee with a beard, wearing an orange polo shirt and a black apron, stands in a fast-food restaurant. The apron has the text "...Y'all Good?" in yellow script. He is holding a white cup with a straw and a paper bag with a pattern of food icons and the word "love" in orange script. The background is a blurred view of the restaurant's interior with warm lighting.

Brand Building Index

Trust builds loyalty, intent drives action, recall ensures brand recognition, and visibility increases brand awareness—key factors that influence consumer behavior, foster brand loyalty, and drive successful marketing strategies.

The Brand Building Index shows a strong overall brand vibrancy score of 95.32% for the latest dynamic month, indicating healthy brand momentum. Long-term trends across visibility, recall, intent, and trust all show steady improvement over time, with recent periods performing at the upper end of the historical range. This suggests brand-building activity is consistently reinforcing awareness and consideration rather than delivering short-term spikes.

The radar and trend charts highlight trust and intent as particular strengths, with recall and visibility also performing solidly but leaving room for further growth. Overall, the data points to a well-balanced brand profile, where sustained activity is translating into stronger consumer confidence and a clearer pathway from awareness through to action.

Methodology Summary: Weighted Engagement Rate (WER%)

This analysis evaluates organic social performance across TikTok, Instagram, and Facebook using a consistent Weighted Engagement Rate (WER%) framework. WER% is designed to reflect the relative value of different engagement actions by applying weighted importance to likes, comments, and shares, recognising that deeper interactions indicate stronger audience intent.

Engagement weights are applied as follows: likes are weighted at 0.5, comments at 2.0, and shares at 10. These weights are used to calculate a total weighted engagement score for each platform, which is then normalised against an appropriate exposure metric to ensure fair comparability.

Facebook WER% is calculated using total post media views as the denominator.
Instagram WER% is calculated using total reach, reflecting unique audience exposure.
TikTok WER% is calculated using total video views, aligned with platform-native consumption behaviour.

All metrics are aggregated at platform level before calculation to avoid distortion from post-level volatility.

The analysis covers available organic social data from January 2024 to January 2025. Only posts with complete engagement and exposure data have been included to ensure methodological consistency across platforms.
