About | Methodology

How to use this dashboard

This dashboard is designed to provide a dynamic, post-level and platform-level view of organic social performance. All pages update in real time based on the selected date range and applied filters, allowing users to move seamlessly from high-level campaign health to individual post diagnostics.

All charts and tables can be exported as images or data files for reporting and sharing.

Campaign Summary

The Campaign Summary provides a high-level snapshot of overall owned social performance across platforms. It includes:

- Total owned media views
- Total weighted engagements
- Overall weighted engagement rate

This page is designed for quick status checks and top-line reporting. All metrics dynamically update based on platform selection and date range filters, making it suitable for exporting as a headline performance summary.

Trending positive means the balance is shifting towards more positive mentions, fewer negative ones, or both, compared to an earlier period. So it's not just that sentiment is positive, it's that it's getting better.

Live Campaign Performance

This page breaks performance down by platform, showing how TikTok, Instagram, Facebook, and X are contributing individually.

For each platform, users can view:

- Views or impressions
- Engagement rates by action type
- Weighted engagements and WER%
- Post volumes

Trend lines show how performance evolves over time, while filters allow users to isolate specific campaigns, hashtags, or keywords. This page is most useful for understanding platform strengths, weaknesses, and shifts in momentum.

Boolean Listening

OR OR AND ("Noah OR OR OR HiddenInTheGreatDivide) OR (Grammys OR "Grammy Awards" OR "2026 Grammys" OR Grammys OR GrammyAwards OR 2026Grammys) OR Collection" OR "MC Collection" OR MCCollection OR ("Noah OR OR AND OR OR

Earned Metrics (from sprinklr)

Earned Reach being the potential audience size based on follower counts and Earned Engagements is the total number of interactions. A single user can generate multiple engagements (likes, comments, shares, views) so it is expected for total engagements to exceed total reach, especially on platforms where views are counted as engagements.

Organic Post Lists (TikTok, Instagram, Facebook, X)

- Each Organic Post List page provides a detailed, exportable table of individual post performance for the selected platform. These pages include: Post imagery and captions
- Views or impressions
- Engagement metrics and rates
- Weighted engagements and WER%

Users can search by text, campaign, hashtag, or keyword, and sort posts by performance. Supporting charts visualise how creative performs relative to engagement and exposure, making these pages ideal for creative analysis, optimisation, and content reviews.

Methodology Summary: Weighted Engagement Rate (WER%)

This analysis evaluates organic social performance across TikTok, Instagram, and Facebook using a consistent Weighted Engagement Rate (WER%) framework. WER% is designed to reflect the relative value of different engagement actions by applying weighted importance to likes, comments, and shares, recognising that deeper interactions indicate stronger audience intent.

Engagement weights are applied as follows: likes are weighted at 0.5, comments at 2.0, and shares at 10. These weights are used to calculate a total weighted engagement score for each platform, which is then normalised against an appropriate exposure metric to ensure fair comparability.

- Facebook WER% is calculated using total post media views as the denominator.
- Instagram WER% is calculated using total reach, reflecting unique audience exposure.
- TikTok WER% is calculated using total video views, aligned with platform-native consumption behaviour.

All metrics are aggregated at platform level before calculation to avoid distortion from post-level volatility.

The analysis covers available organic social data from January 2024 to January 2025. Only posts with complete engagement and exposure data have been included to ensure methodological consistency across platforms.

Advertising Value Equivalency (AVE) estimates the cost of owned or earned media by calculating what the same exposure would have cost if purchased as advertising, often applying a multiplier, in this case \$5x, to reflect the assumed greater impact of earned coverage. AVE answers the question: "If we had paid for this coverage as advertising, how much would it have cost us?" For every \$1 of equivalent advertising cost, You valued the earned exposure at \$5. On the assumption that earned media is more trusted or impactful than paid ads.
